An Introduction to Linear Programming - Williams College Mathematical Introduction To Linear Programming  
 Mathematical elegance is a constant theme in this treatment of linear programming and matrix games. Condensed tableau, minimal in size and notation, are employed for the simplex algorithm. In the context of these tableau the beautiful termination theorem of R.G. Bland is proven more simply than heretofore, and the important duality theorem becomes almost obvious.  Mathematical programming refers to both linear and non-linear optimization. I would recommend this as an introductory book in both the theory and the modeling aspect of operations research/ linear and non-linear optimization. For more advanced theory I would recommend the following (advanced undergrads and graduate students):

 Linear programming is used for obtaining the most optimal solution for a problem with given constraints. In linear programming, we formulate our real life problem into a mathematical model. It involves an objective function, linear inequalities with subject to constraints.

 Linear programming is the process of taking various linear inequalities relating to some situation, and finding the "best" value obtainable under those conditions. A typical example would be taking the limitations of materials and labor, and

then determining the "best" production levels for maximal profits under those conditions.  
 Linear Programming: Introduction - Purplemath  
 Using matrix notation, the constraints can be written as  $Ax \leq b$  and  $x \geq 0$ . The feasible set is the set  $F = \{x \in \mathbb{R}^n : Ax \leq b, x \geq 0\}$ . Since the objective is to maximize  $f(x)$ , the function  $f(x)$  is called the objective function. A nonstandard linear program allows other types of inequalities for the constraints.
